ViVOtech launches NFC infrastructure software with Sun

<http://www.telecompaper.com/news/SendArticle.aspx?u=False>

ViVOtech, a US NFC m-payments services provider, has made its NFC infrastructure software ViVOnfc Suite 2.8 available on the Solaris 10 operating system and Sun Microsystems hardware for commercial deployments.

ViVOnfc Suite 2.8, which integrates a NFC wallet and OTA card provisioning software, enables mobile network operators, trusted service managers, card issuers, merchants as well as marketing services companies to manage payment cards, coupons and tickets on NFC-enabled handsets.

The company's ViVOnfc 2.8 incorporates the ViVOplatform Issuer Server, ViVOplatform Control Server and ViVOWallet mobile phone application. The ViVOnfc Issuer Server offers card provisioning services for NFC mobile handsets, enabling the issuer to gain control over card data.

The ViVOnfc Control Server provides administrative services to allow for multiple payment, loyalty and promotion applications via an embedded or SIM-based tool on a mobile payment device. The ViVOWallet application enables multiple payment-related applications to manage data. Via the ViVOWallet interface, payment card or coupon data can be directly sent to POS terminals with an integrated contactless reader.
